

ABSTRACT

An apparatus, a system and a method collects drips from a frozen treat on a stick or a double-stick frozen treat having a tray with a cover on a side of the tray. The stick of the frozen treat has a handle or two sticks of the double-stick frozen treat have two handles which extends outside of the frozen treat. The cover is made from an absorbent material. Further, the tray has an opening which receives the handle of the stick or handles of the double-stick frozen treat. The handle or two handles are inserted into the opening until the cover abuts the frozen treat. Still further, the opening allows the stick or the two sticks of the frozen treat to be held in an upright position above the cover. Moreover, the cover collects the drips from the frozen treat and/or absorbs the drips from the frozen treat. The opening prevents the drips from the frozen treat from flowing down the handle of the stick or two handles of the double-stick frozen treat. Furthermore, the tray prevents the collected drips from spilling onto a user and/or surroundings of the user.
